The real old thing is a <sup>copy</sup> that  
has no more connection with the effect  
of it all than an <sup>idea</sup> in the

hand of a man who has never  
seen the thing which it is supposed to  
represent. It is a mere copy of a  
copy, and so on, until it becomes  
a mere shadow of the original.

By Mr B

Over pistil or stamen  
are from mother?

2. B. in 2 & 3. "communis" sometimes in Bracket, sometimes not. -

no 5. I presume must be some blunder of Trinitas

no 6. Can there have been several of Trinitas

The plants named calycantha are forms of the several species in which the calyx has become very much enlarged and coloured to a more or less extent (usually greatly) like the corolla. The name is the form so used in the German systematicists such as Mertens & Koch Deutschl. Flora, &c. *P. elatior* var. *calycantha* was once called a species (*P. calycantha*) by Retz. Tus

by "communis" is merely intended "common form". It is not a name.  
No 5. veris and officinalis are synonymous terms, ~~both~~ each having  
been used to denominate the true cowslip which by Linnaeus was  
called P. veris & officinalis. (C. C. Babin, ten)
